

# **TDA Graph Coarsening Benchmark**

Kelly Williams

# Background

## Motivation for Graph Coarsening

- Large-scale graphs may involve complex structures
  - Difficult to compute and analyze key properties directly from large graphs
- Coarsened Graph** – Graph of reduced size that preserves important graph properties
- Applications: GNNs, Biology, Graphics, etc.
- Related: Clustering unstructured point-cloud data

Ball Mapper & Mapper

## Brief Aside

- ◎ ***A Comprehensive Survey on Graph Reduction: Sparsification, Coarsening, and Condensation*** (2024) – Hashemi, et al.
- ◎ **Graph Reduction** – General term for reducing the size of the graph dataset, including the number of graphs, nodes, and edges
  - **Coarsening** – Group and aggregate similar nodes and edges to construct a smaller graph
  - **Sparsification** – Selecting significant nodes and edges while discarding others
  - **Condensation** – Learn a synthetic graph from scratch

Coarsening

Sparsification

Condensation

# Coarsening Algorithms

# Maximal Matching Coarsening

## Basic Algorithm

- ◎ Find a maximal matching in the graph
  1. **Maximal Matching** – maximal set of edges, no two of which are incident on the same vertex
- ◎ For each Matching Edge (i; j):
  1. Contract edge to **form new vertex v**
  2. Accumulate **vertex weight**  $\rightarrow \text{weight}(v) := \text{weight}(i) + \text{weight}(j)$
  3. Connect neighboring edges to new vertex v
  4. If i and j were both adjacent to a neighbor vertex k  
Accumulate **edge weight**  $\text{weight}(v; k) := \text{weight}(i; k) + \text{weight}(j; k)$

# Spectral Guarantees Coarsening

## (a little more complicated...)

- 1: **Input:** Graph  $\mathcal{G} = (\mathcal{V}, \mathcal{E}, \mathbf{W})$ , eigenvectors  $\mathbf{U}$  of the normalized Laplacian  $\mathcal{L}$ , target size  $n$ .
- 2: **if**  $\lambda(N) \leq 1$  **then**
- 3:     Set  $k_1 \leftarrow n$  ▷ Spectral Clustering
- 4: **else**
- 5:     Set  $k_1 \leftarrow \arg \min_k \{k : \lambda(k) \leq 1, k \leq n, \lambda(N - n + k + 1) > 1\}$  ▷ Iterative Spectral Coarsening
- 6:  $k_2 \leftarrow N - n + k_1$ .
- 7: **while**  $k_1 \leq n$  **do**
- 8:      $\mathbf{U}_{k_1} \leftarrow [\mathbf{U}(1 : k_1); \mathbf{U}(k_2 + 1 : N)]$
- 9:     Apply  $k$ -means clustering algorithm on the rows of  $\mathbf{U}_{k_1}$  to obtain graph partitions  $\mathcal{P}_{k_1}^*$  that optimizes the following  $k$ -means cost:

$$\mathcal{F}(\mathbf{U}_{k_1}, \mathcal{P}_{k_1}^*) = \sum_{i=1}^N \left( \mathbf{r}(i) - \sum_{j \in \mathcal{S}_i} \frac{\mathbf{r}(j)}{|\mathcal{S}_i|} \right)^2$$

where  $\mathbf{r}(i)$  is the  $i^{\text{th}}$  row of  $\mathbf{U}_{k_1}$ .

- 10:      $k_1 \leftarrow k_1 + 1, k_2 = N - n + k_1$
- 11: **return** coarse graph  $\mathcal{G}_c$  generated with respect to the partitions with minimum  $k$ -means clustering cost as

$$\mathcal{P}^* = \arg \min_{k_1} \mathcal{F}(\mathbf{U}_{k_1}, \mathcal{P}_{k_1}^*)$$

◎ Build a subgraph that is as structurally similar to the original graph as possible

## Parallel 2MIS

- Find the Maximal Independent Set in parallel to determine which nodes in the **original graph G** are Supernodes
- Nodes of the new coarsened graph become all nodes within 2 edges of the Supernodes in **G** [ 2MIS ]
- Similar accumulation process to Maximal Matching

Ex. 1MIS

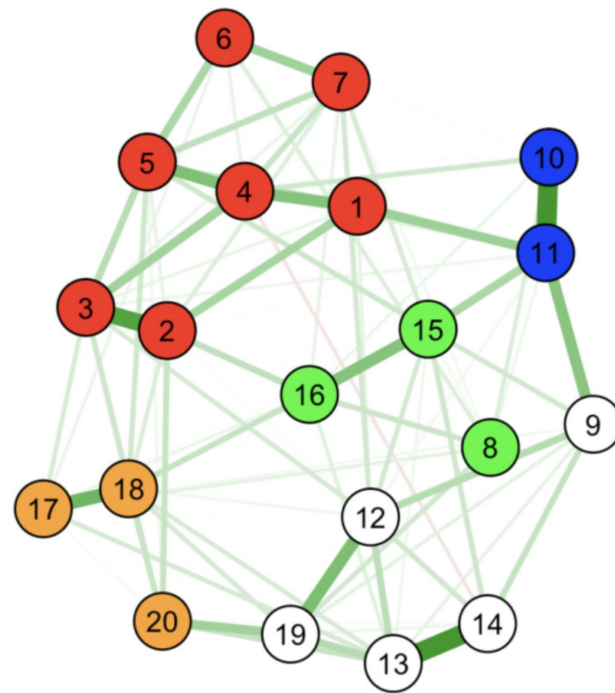

\*Graph size is small so exact coarsenings can vary

## Adapted Walktrap Community Detection

- Algorithm based on Pons and Latapy's Community Detection
- Choose a set of nodes** and **perform random walks** that are a specified set of **steps** away to determine communities
- Adapted for coarsening: the **communities** become **Supernodes** for the coarsened graph
- Chosen for its similarity to the BallMapper algorithm (Dlotko, 2019)
  - Radius of ball in point cloud = Steps from node in structured graph

<https://psych-networks.com/r-tutorial-identify-communities-items-networks/>

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by small circles, some of which are larger and have concentric circles, suggesting a hierarchical or multi-layered structure. The lines are thin and gray, connecting the nodes in a non-linear fashion.

# Benchmark

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of nodes connected by lines, with some nodes being larger and having concentric circles, indicating a similar hierarchical or multi-layered structure. The lines are thin and gray.

## Implementation

- ◎ Graph: **bcspwr10** from Graph500
  - # of Vertices = 5300
  - # of Edges = 8271
- ◎ Coarsen the graph with each algorithm and analyze metrics
  - Do 1 round of coarsening
  - If the algorithm requires a coarsening goal, use **75%** of the original graph
- ◎ \*Some algorithms are self-implemented and may not be in their most efficient state

## Current Metrics

- ◎ # of Vertices
- ◎ # of Edges
- ◎ Approximate Connectivity
- ◎ Density
- ◎ # of Connected Components
- ◎ # of Basis Cycles
- ◎ \*Time → not all implementations are the most efficient

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by small circles, some of which are highlighted with a double-circle outline. The lines are thin and gray, creating a mesh-like structure.

# Results

(so far)

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of nodes connected by lines, with some nodes having a double-circle outline. The overall style is minimalist and technical.

# Results Table

	V	E	~ Connectivity	Density	# CCs	# Basis Cycles	Time (s)
Original	5300	8271	1	0.000589	1	2972	
MaxMatch	2916 ( 0.55)	5406 (0.65)	1	0.001272	1	2491	0.0110979
Spectral r=0.25	2187 (0.41)	4176 (0.50)	1	0.001747	1	1990	2.0681710
2MIS	1090 (0.21)	4904 (0.59)	1	0.003598	1	1047	0.12111700
Walktrap step=4	47 (0.008)	86 (0.01)	1	0.079556	1	40	0.0636663

## Maximal Matching Coarsening

## Walktrap Coarsening

# Spectral Coarsening

# Time Complexity (Theoretical)

- ◎ Maximal Matching Coarsening =  **$O(M) * O(k)$** 
  - $M$  = # of edges in Maximal Matching
  - $k$  = time to edit graph (depends in data structures)
  
- ◎ Spectral Coarsening =  **$O(KTNn^2)$** 
  - $K$  = # of while loop  $k$ -cluster iterations w/  $K \leq n$
  - $TNn^2$  = the complexity of the  $k$ -means clustering
    - ◎  $T$  bounds the # of  $k$ -means iterations
  
- ◎ Parallel 2MIS\* =  **$O(V \log V + E \log V + V \log^2 V)$** 
  - Parallel algorithms are complex and this does not cover the whole coarsening process
  
- ◎ Walktrap =  **$O(n^2 \log n) * O(k)$** 
  - $k$  = time to edit graph (depends in data structures)

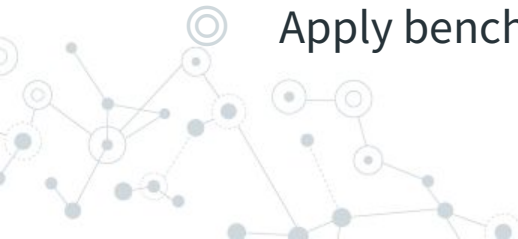

A decorative network diagram in the top-left corner, featuring a complex web of interconnected nodes and lines. The nodes are represented by small circles, some of which are larger and have concentric circles, suggesting a hierarchical or central structure. The lines are thin and gray, connecting the nodes in a non-linear fashion.

# **Future Work**

A decorative network diagram in the bottom-right corner, similar to the one in the top-left. It shows a cluster of nodes connected by lines, with some nodes being larger and more prominent than others, indicating a focal point or a specific area of interest within the network.

## Future Work

- ◎ Parallelize the algorithms more when applicable
  - ◎ Adjust Walktrap step size if possible
  - ◎ Explore at least 1 more algorithm in the current benchmark
  - ◎ Include more metrics and include nicer visuals to better represent the results
  - ◎ Compare the algorithms in C/C++ in order to compare performance on different architectures
  - ◎ Apply benchmark to more complex algorithms [[Zollner, 2011](#)]
- 

## Final Report Goals (stay tuned)

- ◎ Involve persistence to track features as graph is coarsened
- ◎ See if Ball Mapper can be applied to data that is structured and has relations
- ◎ Add one or two more algorithms
- ◎ Analyze more metrics based on the coarsenings
