Math 135: Discrete Mathematics, Spring 2010 Homework 2

Due in class on Monday, Feb. 1, 2010

For this homework, you may write up solutions with 1 partner; both of you will receive the same grade based on your joint writeup. Please make sure to read the course policies on homework *before* writing up your homework.

- 1. Prove that if n is a positive integer, then n is even if and only if 7n + 4 is even.
- 2. Prove or disprove that the product of a (nonzero) rational number and an irrational number is irrational.
- 3. Prove that the square of an integer ends with 0, 1, 4, 5, 6, or 9. (Hint: Let n = 10k + l where $l = 0, 1, 2, \dots, 9$).
- 4. (a) Prove that for any $n \ge 1$, $n^2 \ge n$.
 - (b) Prove that $n! < n^n$ if n > 1
- 5. Prove that $1 \cdot 1! + 2 \cdot 2! + \cdots + n \cdot n! = (n+1)! 1$ whenever n is a positive integer.
- 6. Assume that a chocolate bar consists of *n* squares arranged in a rectangular pattern. The bar can only be broken along vertical or horizontal lines separating the squares. (Think of a Hershey's bar.)

Assuming that only one piece can be broken at a time, determine how many breaks you must make in order to break the bar into n squares. Use induction to prove your answer is correct.
