

CS150 - More if statements

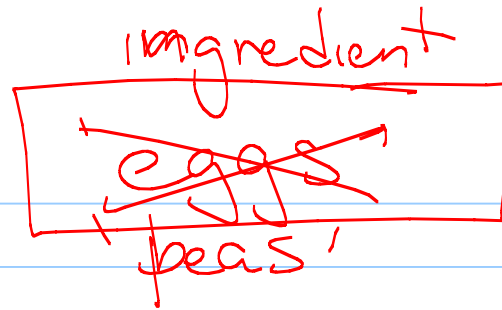

Note Title

2/6/2012

Announcements

- HW1 - email grade tonight
- HW3 due in 1 week
 - can work w/ partner
 - based on Ch 2 question, so don't need loops or ifs.

Quiz recap:

```
food = ['eggs', 'peas', 'broccoli', 'salt']
```

```
for ingredient in food:  
    print ingredient[2]
```

Good

If statements

Ex:

```
weight = float(raw_input('How many  
pounds does your suitcase weight? '))
```

```
if weight > 50:
```

```
    print 'There is a $25 charge for  
    luggage that heavy.'
```

```
    print 'Thank you for your business.'
```

If-else

```
temp = float(raw_input('What is  
the temperature?'))
```

```
if temp > 70:
```

```
    print 'Wear shorts.'
```

```
else:
```

```
    print 'Wear long pants.'
```

```
print 'Let's go outside!'
```

Nested if `if ():
 if ():
 else:
 - - -`

`if ():
 if ():
 else:`

```
if temp > 70:  
    print 'Wear shorts.'  
else:  
    if temp > 60:  
        print 'Wear pants and a tshirt.'  
    else:  
        print 'Wear pants, and don't forget a coat.'
```

Can get difficult with spacing...

Elif:

```
if temp > 70:  
    print 'Wear shorts.'  
elif temp > 60:  
    print 'Wear pants and a tshirt.'  
elif temp > 30:  
    print 'Wear pants, and don't forget a coat.'  
else:  
    print 'Bundle up!'
```

Another elif:

Program to let the user enter a
number.

Compare it to "secret" number,
and tell them if they guessed
correctly or were too low
or too high.

Practice:

P. 4.20

```
for x in range(20):  
    if x % 9 == 0:  
        print x, 'is divisible by 9'  
    elif x % 3 == 0:  
        print x, 'is divisible by 3'
```

Output?

(code it to check if you're correct)

P 4.19

Write code that, given a list of strings, produces a new list, short words, that includes all original strings of length 3 or less.
