

CS150 - Recursion

Note Title

4/2/2012

Announcements

- HW4 grade emailed Friday
- HW8 is up - due next Monday
- Review Tuesday, exam Wednesday
(next week)
- No class Friday or Monday
- Get sample midterm 2 - no inheritance or Ch. 10

List Comprehension (Ch 4.5, p 148)

A short cut when working on lists

Example: $l = [0, 1, 2, 3, 4]$

$m = []$

for e in l :
 $m.append(e * e)$

put these in new list

Shorter: $m = [e * e \text{ for } e \text{ in } l]$

for all elements
in a list

List comprehension, cont

Can also filter:

$m = [e * e \text{ for } e \text{ in } L \text{ if } e \% 2 == 0]$

Multiple comprehensions:

$[x + y \text{ for } x \text{ in "SPAM" for } y \text{ in "spam"}]$
 $\rightarrow ['Ss', \dots]$

(but gets hard to read, so don't get carried away)

Program design (Ch. 7)

Designing larger systems

Example: a library

- books

- users

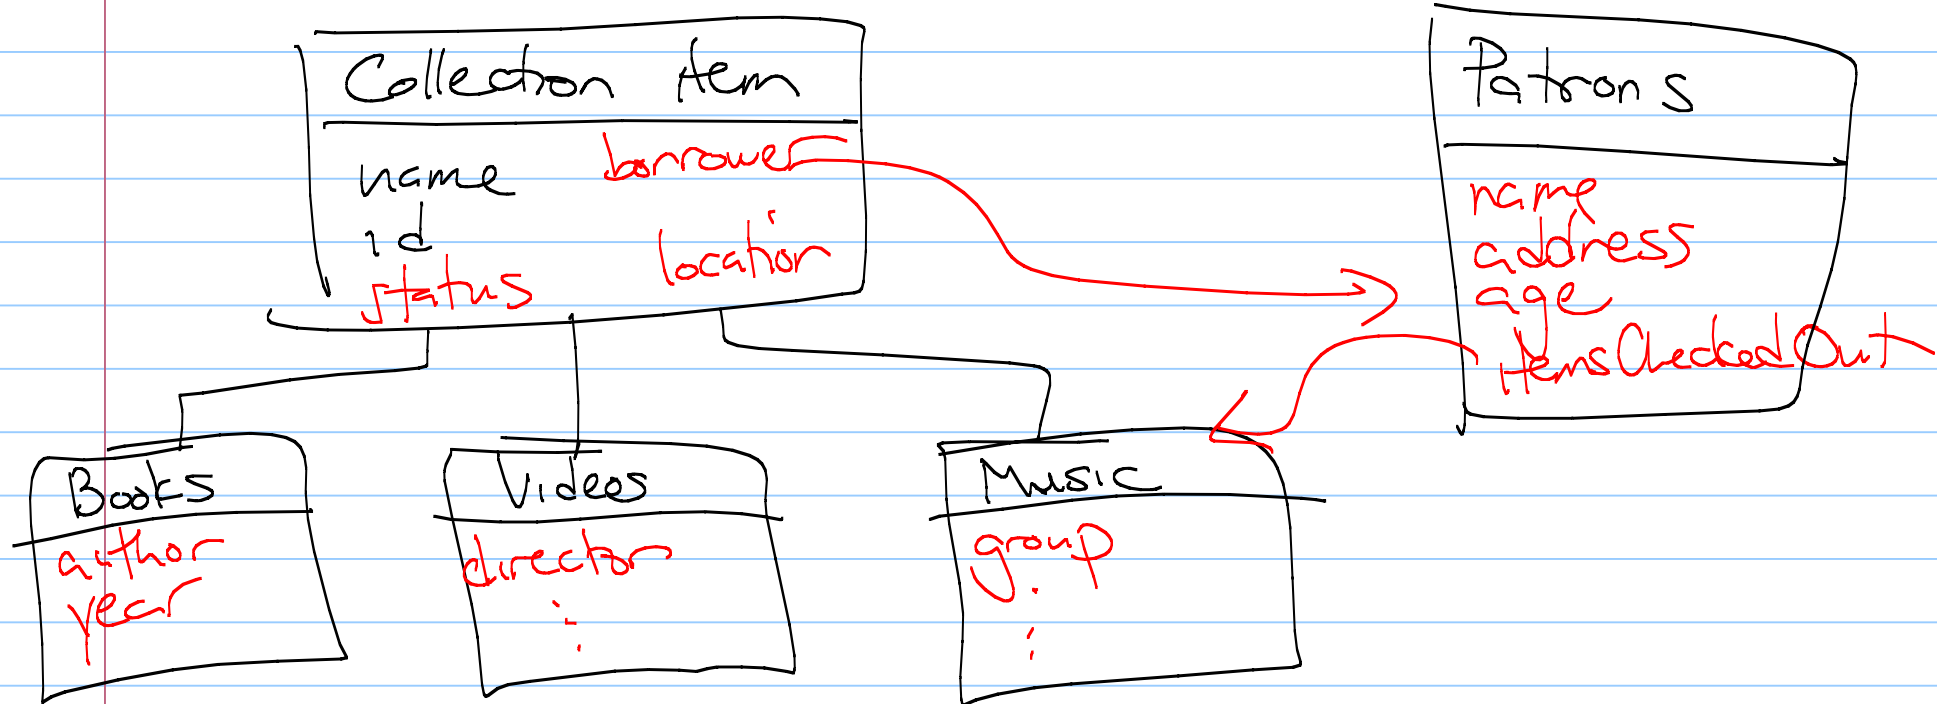

- music

- games

- movies

checks-out

all have id & title, location

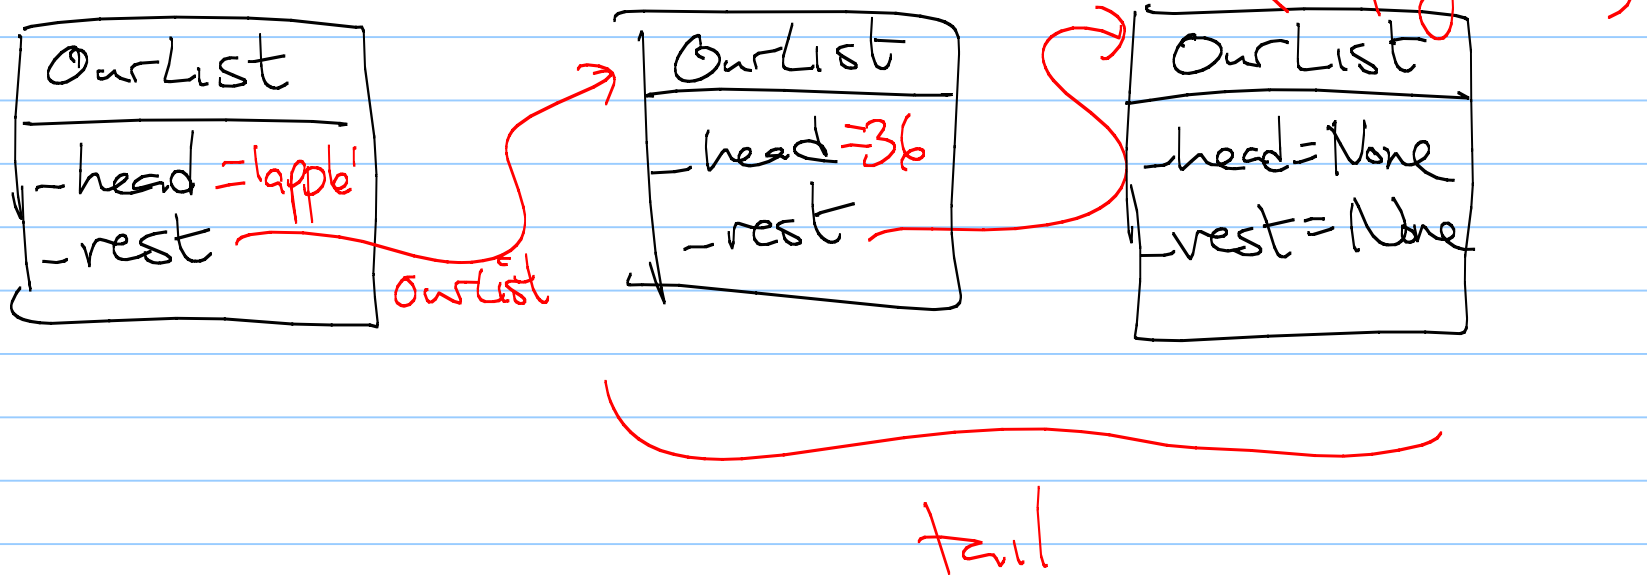

who has checked what

(Ch. 11)

Back to recursion: Data structures

Designing a list: class OurList:

Appending: mylist.append(12)

mylist

value

self.isEmpty()

```
if self._head == None:
    self._head = value
    self._rest = OurList()
else:
    self._rest.append(value)
```

} base case

Functions

- __init__

- is Empty

- append

- count

- __contains__
