

# CS443 - Networks (pt 2)

Note Title

2/4/2013

## Announcements

- Quiz today

- HW2 due

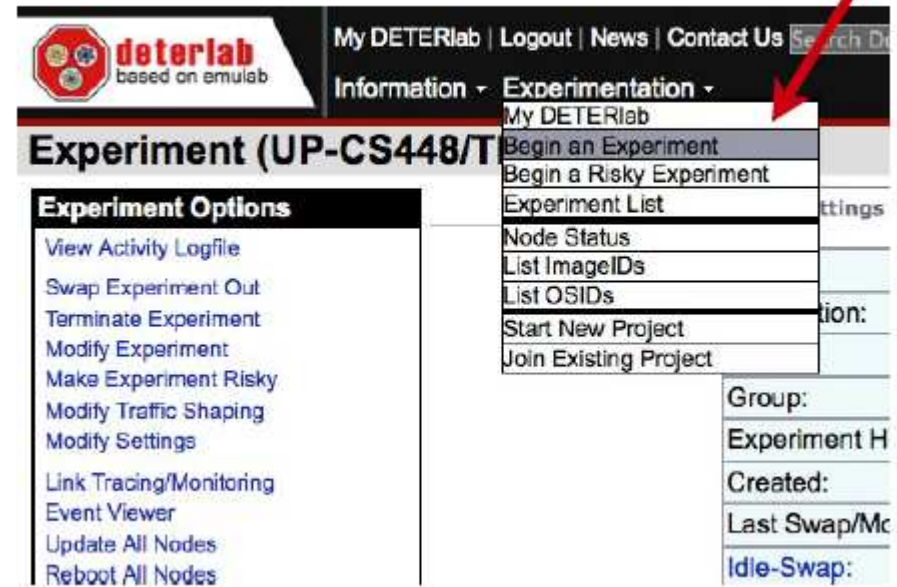

- Lab 3 up - due in 1 week

# The Lab: IPTables

- Go to [deterlab.net](http://deterlab.net)

- Login

- Go to "Begin an Experiment"

The screenshot shows the DETERlab web interface. At the top, there is a navigation bar with the DETERlab logo (based on emulab) and links for "My DETERlab", "Logout", "News", and "Contact Us". Below this, there are tabs for "Information" and "Experimentation". The "Experimentation" tab is active, and a dropdown menu is open, showing options: "My DETERlab", "Begin an Experiment" (highlighted), "Begin a Risky Experiment", "Experiment List", "Node Status", "List ImageIDs", "List OSIDs", "Start New Project", and "Join Existing Project". A red arrow points to the "Begin an Experiment" option. Below the navigation bar, the main content area is titled "Experiment (UP-CS448/T)". On the left, there is a section titled "Experiment Options" with a list of actions: "View Activity Logfile", "Swap Experiment Out", "Terminate Experiment", "Modify Experiment", "Make Experiment Risky", "Modify Traffic Shaping", "Modify Settings", "Link Tracing/Monitoring", "Event Viewer", "Update All Nodes", and "Reboot All Nodes". On the right, there are several input fields for configuration: "Group:", "Experiment H", "Created:", "Last Swap/Mc", and "Idle-Swap:".

Enter info:

## Begin a Testbed Experiment

- If you have an NS file:  
You may want to [syntax check it first](#)
- If you do not have an NS file:  
[New GUI editor](#) - An enhanced Java applet for editing topologies.
- For manipulating your experiment, consider [SEER](#).

Select Project:	UP-CS448
Group:	Default Group (Must be default or correspond to selected project)
Name: (No blanks)	<input type="text"/>
Description: (A concise sentence)	<input type="text"/>
Your NS file: <input type="button" value="Syntax Check"/>	Upload (500k max) <input type="text"/> <input type="button" value="Browse..."/> or On Server (/proj, /users, /groups, /share) <input type="text"/>
Swapping:	<input checked="" type="checkbox"/> <b>Idle-Swap:</b> Swap out this experiment after <input type="text" value="4"/> hours idle. If not, why not? <input type="text"/> <input checked="" type="checkbox"/> <b>Max. Duration:</b> Swap out after <input type="text" value="12"/> hours, even if not idle.
Linktest Option:	Skip Linktest <input type="button" value="What is this?"/>
<input type="checkbox"/> Swap In Immediately	
<input type="button" value="Submit"/>	

The visualization tab will show the network architecture of this experiment.

(Will be useful in later labs, too.)

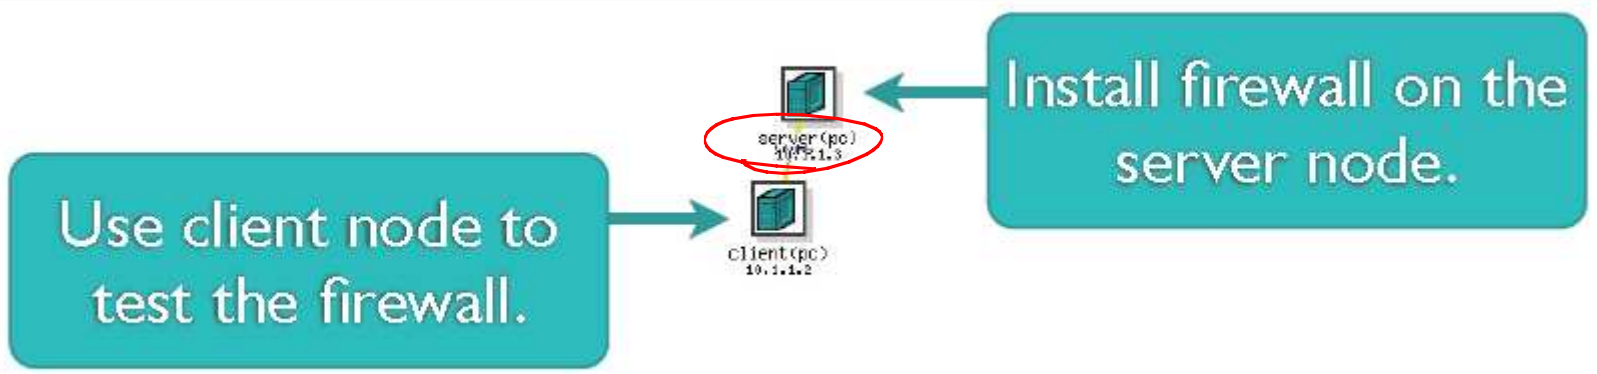

Settings Visualization NS File Details

This lab:

Two goals:

Settings Visualization NS File Details

Edit & run the firewall script

```
up448ar@server:~$ cd /root/firewall
```

```
up448ar@server:/root/firewall$ ls
```

```
extingui.sh  extingui.sh~  firewall.sh  firewall.sh~  iptables_reset  
tester.sh
```

make your edits

```
up448ar@server:/root/firewall$ sudo sh firewall.sh
```

```
Starting firewall: done.
```

Note:

Use `extingui.sh` to reset between attempts.

```
up448ar@server:~$ cd /root/firewall
```

```
up448ar@server:/root/firewall$ ls
```

```
extingui.sh  extingui.sh~  firewall.sh  firewall.sh~  iptables_reset  
tester.sh
```

```
up448ar@server:/root/firewall$ sudo sh extingui.sh
```

```
up448ar@server:/root/firewall$
```

# IPtables : Quick intro

-L : list rules

```
% sudo iptables -L
```

```
Chain INPUT (policy ACCEPT)
```

```
target      prot opt source                destination
```

```
Chain FORWARD (policy ACCEPT)
```

```
target      prot opt source                destination
```

```
Chain OUTPUT (policy ACCEPT)
```

```
target      prot opt source                destination
```

## Adding a rule:

**-A:** Append a rule to the INPUT, OUTPUT or FORWARD chain.

**-p:** Specify a protocol.

**-d:** Specify a destination port.

**-j:** Specify a target:

**ACCEPT:** Accept the packet.

**REJECT:** Reject the packet, notify the sender.

**DROP:** Silently ignore the packet.

**LOG:** Log the packet.

Example:

Add rule to accept incoming ssh traffic:

```
iptables -A INPUT -p tcp --dport 22 -j ACCEPT
```

Also: restrict based on where it is from

-i: input interface.

-o: output interface.

-s: source, e.g., a machine name or an IP address.

Si  
c

```
up448ar@server:~$ ifconfig
```

```
eth4      Link encap:Ethernet  HWaddr 00:1b:21:1e:ac:14  
            inet addr:10.1.1.3  Bcast:10.1.1.255  Mask:255.255.255.0  
            inet6 addr: fe80::21b:21ff:fe1e:ac14/64 Scope:Link  
            UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1  
            RX packets:0 errors:0 dropped:0 overruns:0 frame:0  
            TX packets:9 errors:0 dropped:0 overruns:0 carrier:0  
            collisions:0 txqueuelen:100  
            RX bytes:0 (0.0 B)  TX bytes:706 (706.0 B)
```

```
eth8      Link encap:Ethernet  HWaddr 00:13:72:4e:cc:6d  
            inet addr:192.168.1.181  Bcast:192.168.3.255  Mask:255.255.252.0  
            inet6 addr: fe80::213:72ff:fe4e:cc6d/64 Scope:Link  
            UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1  
            RX packets:14551 errors:0 dropped:0 overruns:0 frame:0  
            TX packets:2131 errors:0 dropped:0 overruns:0 carrier:0  
            collisions:0 txqueuelen:1000  
            RX bytes:18471062 (18.4 MB)  TX bytes:199954 (199.9 KB)
```

Then use this:

```
iptables -A INPUT -i eth4 -s server -j DROP
```

What does this rule do?

Drop all incoming traffic on eth4  
from server

Networking :

The Internet Protocol Suite, informally called TCP/IP, is an implementation of the OSI model.

Recall :

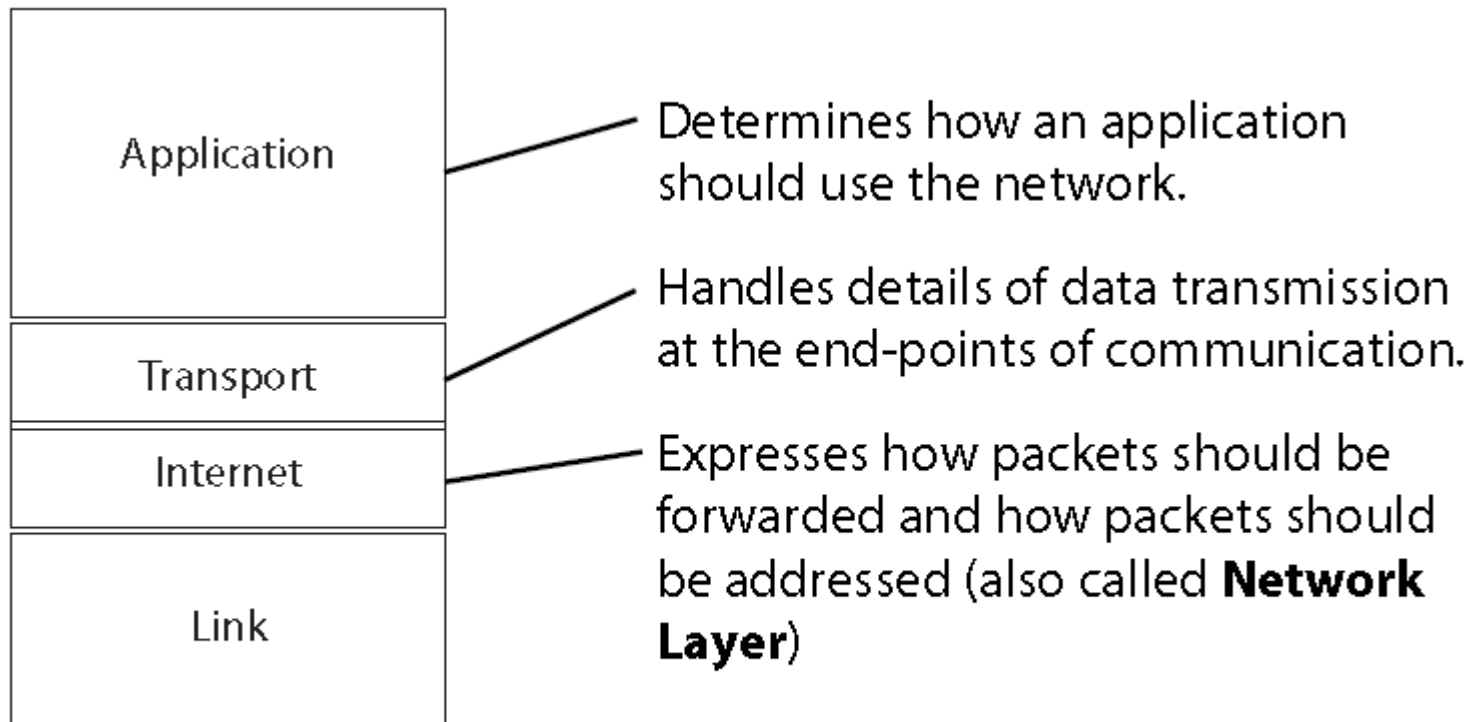

**OSI Model**

**TCP/IP**

# TCP/IP Layers

**TCP/IP**

# TCP/IP Layers

**TCP/IP**

Sometimes divided into Link Layer and Physical Layer.

**Link Layer:** Provides for synchronization and transfer of information. Defines how physical machines address each other.

**Physical Layer:** Defines electrical aspects of sending signals along a wire or wirelessly. Also addresses switch and router hardware.

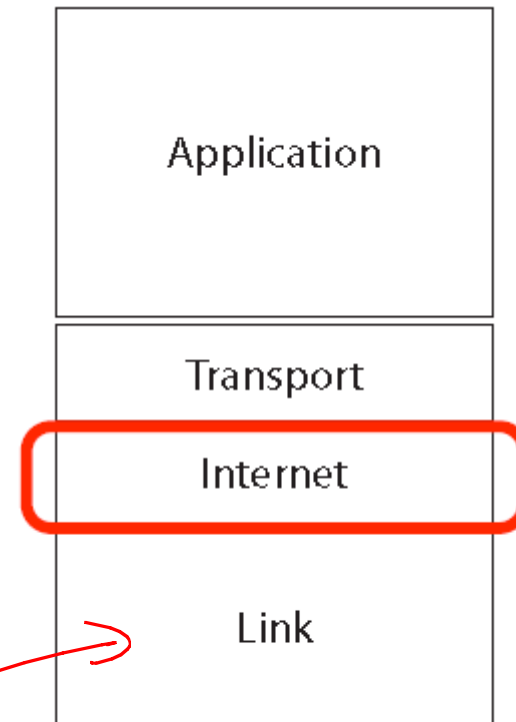

# TCP/IP:

We'll focus on the Internet layer -

how packets are addressed and forwarded over the network.

(Also called Network layer.)

**TCP/IP**

## Headers in IPv4:

- Divided into 32-bit segments

- Headers are 5 segments long (usually), with data at the end

bit offset	0-3	4-7	8-13	14-15	16-18	19-31
0	Version	Header Length	Differentiated Services Code Point	Explicit Congestion Notification	Total Length	
32	Identification			Flags	Fragment Offset	
64	Time to Live		Protocol		Header Checksum	
96	Source IP Address					
128	Destination IP Address					
160	Options ( if Header Length > 5 )					
160 or 192+	Data					

# IP<sub>v4</sub>

10.1.1.3

Class A

126 networks, 16 million hosts

Class B

16382 networks, 65,534 hosts

Class C

2 million networks, 254 hosts

Class D

~~designed for multicasting~~

Class E

~~reserved for experiments~~

Example: Consider the address:

10001000 11100101 11001001 0001000

Class? B

What IP? 136.229.201.8

Problem:

IPv4 was designed in 1981.

Classes A-C allow for under  
4.3 billion address total.  
(Reality - much smaller!)

Conclusion: Problem - out of space.

## Solutions

- ① IPv6
- ② NAT
- ③ Subnetting

None is a perfect cure but all have been used to offset issues.

# ① IPv6

- Invented in 1998

- Allows for 128-bit addresses  
(versus 32-bit)  $2^{32}$  vs.  $2^{128}$

- Transition has been slower than expected: as of Nov. 2012, reported to be  $\sim 1\%$  of total traffic.

## IPv6 details:

- Packet headers are twice as long.
- However, processing is actually simpler & faster at routers.
- Privacy extensions exist to "hide" identity: OS generates random host ID identifier.

## ② Network Address Translation

A router stands between a private network & outside world.

Every internal IP address maps to a single IP/port which is all outside sees.

(Combines well with firewall functionality.)

Pros of NAT: - effectively a firewall  
- only need 1 IP

Cons: - single point of failure  
- significant overhead

### ③ Subnetting

There is a jump between class B and C sizes.

Class B

**16382 networks, 65,534 hosts**

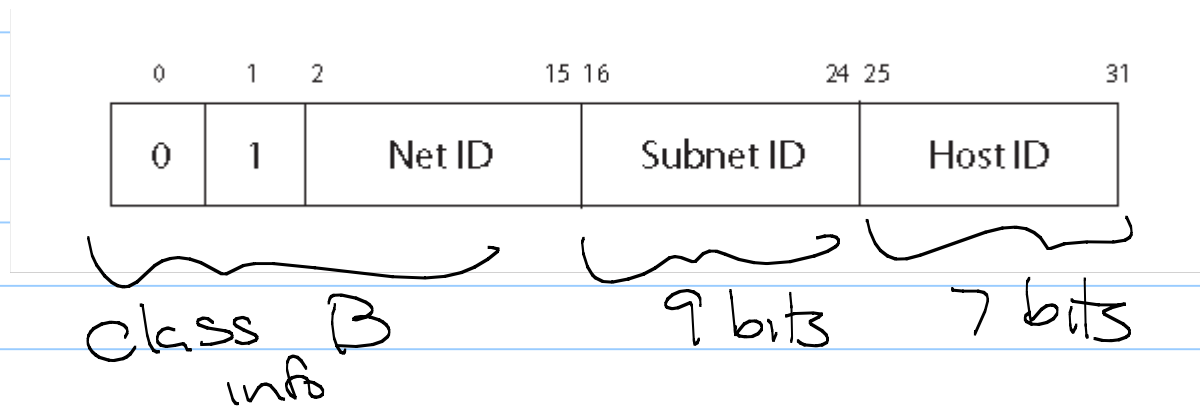

Class C

**2 million networks, 254 hosts**

Many larger networks actually subdivide them further.

Example:

# subnets :  $2^9$

# hosts in each :  $2^7$

Subnets cont:

Every computer gets a subnet mask,  
eg 255.255.255.128

As well as an IP: 128.96.34.15

Take the bitwise AND to get the subnet versus host id:

AND:  $11111111.11111111.11111111.10000000$   
 $10000000.01100000.00100010.00001111$

$\underbrace{\hspace{15em}}_{\text{net id}} \quad \underbrace{\hspace{15em}}_{\text{Subnet id}} \quad \underbrace{\hspace{15em}}_{\text{host id}}$

# Local Area Networks

A LAN is a "small interconnection infrastructure that typically uses a shared transmission medium".

From Computer and Communication Networks by N. Mir

Note: A single LAN may actually be huge. ↓

"Local" is relative, but generally these all connect to same router or switch.

# LAN Topologies

Bus Configuration

Star Configuration

Ring Configuration

# Bus Configuration

Transmissions are propagated on the bus in both directions.

All users (locally) will receive all packets.

# Ring Configuration

Ring Configuration

Sender gives packet to Repeater.

Repeater forwards until reaches destination.

If reaches original source, not forwarded any further.

# Star configuration

Star Configuration

Center of "star" is a multi-port hub or switch.

Frames are sent to center, which either broadcasts or sends to targeted destination.

Note:

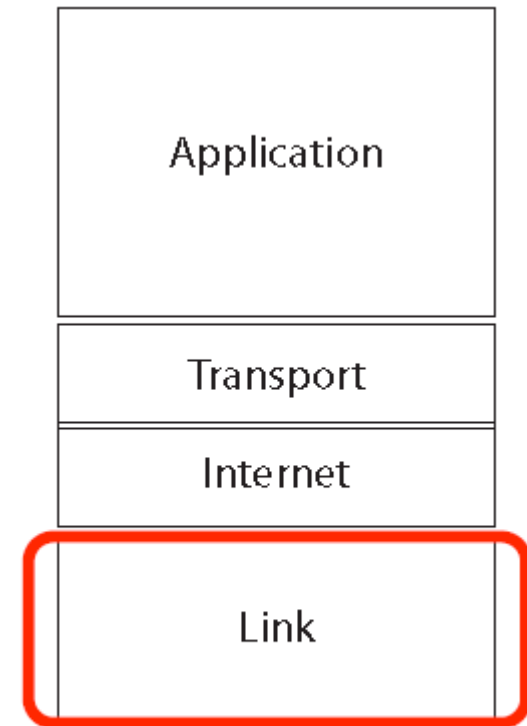

None of these have much  
security!

All are vulnerable to attack and  
to eaves dropping.

# Adding Security

To address this, we'll dive down a level to the Link layer.

(More next time!)

**TCP/IP**
